Antagonistic action on anaphylactic asthma in guinea pigs

Male Hartley-strain guinea pigs weighing 305-400 g were used. These animals were sensitized by intravenous injection of 0.5 ml/animal of rabbit antiserum to egg-white albumin (PCA antibody titer 4,000). After 24 hours, the animals were housed individually in 5.3-liter plastic chambers. Using a commercial sprayer, a 5% egg-white albumin solution was sprayed in the form of an aerosol into each chamber at a rate of 0.16 ml/min for 2 minutes. Thirty minutes prior to the spraying of the egg-white albumin solution, the test compound was administered orally in varied concentrations. Each dosed group consisted of 5 animals. The prophylactic effect to anaphylaxis was expressed in terms of the ED₅₀ value determined on the basis of the number of guinea pigs which has survived for not less than 2 hours after antigen spraying for each administration concentration of the test compound. The values thus obtained are given in the following table.

Anti-SRS-A activity

Peritoneal exudate cells were collected from glycogen-injected SD rats and adjusted to 1 x 10⁷ cells/ml with Tyrode's solution. One milliliter of the cell suspension was incubated with indomethacin (10 µg/ml) and

each varied concentration of the test compound for 10 minutes and, then, further incubated with Ca^{++} -ionophore (A23187, 1 $\mu\text{g/ml}$) for 10 minutes. The supernatant was collected by centrifugation and the SRS-A (slow-reacting substance of anaphylaxis) activity was determined in terms of contractility of the isolated guinea pig ileum in the presence of mepyramine, atropine and methysergide.

5 The results were expressed in terms of the 50% inhibitory concentration to SRS-A synthesis or release from peritoneal exudate cells.

Example 3

To a solution of 1-[2-{5-[3,5-di-tert-butyl-4-[(2-methoxyethoxy)methoxy]phenyl]-(2E,4E)-2,4-pen-

tadienoylamino]ethyl]-4-(3-indolyl)piperidine (0.5 g) in methanol (5 ml) was added dropwise methanesulfonic acid (0.26 ml) at 18-25°C. After 2 hours the reaction mixture was adjusted to pH 7.5 with 2N-sodium hydroxide and then poured into saturated sodium bicarbonate solution (50 ml). The resulting precipitate was collected and washed with water. The precipitate was subjected to column chromatography on silica gel and eluted with a mixture of chloroform and methanol (20:1, V/V). The fractions containing the object compound were combined and concentrated under reduced pressure. The residue was recrystallized from 1,4-dioxane, to give white crystals of 1-[2-[5-(3,5-di-tert-butyl-4-hydroxyphenyl)-(2E,4E)-2,4-pentadienoylamino]ethyl]-4-(3-indolyl)piperidine (0.28 g). See Example 2-(35).

After stirring for 2 hours, the reaction mixture was adjusted to pH 7.2 with aqueous 2N sodium hydroxide solution, and poured into a solution of 4.5 g of sodium bicarbonate in 500 ml of water. After stirring for 30 minutes, the resulting precipitate was collected by filtration and washed with 100 ml of water. The residue was subjected to column chromatography on silica gel and eluted with a mixture of chloroform and methanol. The fractions containing the object compound were combined and concentrated under reduced pressure. The residue was recrystallized from ethanol to give 1-[2-[5-(4-hydroxy-3,5-dimethoxyphenyl)-(2E,4E)-2,4-pentadienoylamino]ethyl]-4-(3-indolyl)-piperidine (6.69 g). See Example 2-(19).
